

Spring Framework

Spring Framework

Spring is an Integration Framework

Built around the idea of Dependency Injection

Created as a light weight alternative to JEE and EJB

Integrates many Open Source projects into a standard programming model

Configuration

Everything needs to be configured in Spring Framework

Previously configuration was handled by XML files

Now it can be handled by Java config and Annotations

Spring Boot builds on Spring Framework and handles configuration automatically by using conventions and by looking at the dependencies on the classpath

Spring Framework and Spring Boot
